TITLE: Cross section for absorption of Gamma quanta by carbon nuclei in the giant resonance region

SOURCE: Zhurnal eksper. i teoret. fiziki, v. 45, no. 6, 1963, 1693-1703

TOPIC TAGS: carbon nucleus, gamma absorption cross section, giant resonance, nuclear absorption, nuclear absorption cross section, integral cross section

ABSTRACT: In order to gain additional information about the high-lying excited levels of carbon, the cross section for nuclear absorption of γ rays by carbon was measured by the absorption method in the 13--27 MeV region, using the 250-MeV synchrotron of the

Card 1/3

ACCESSION NR: AP4009083

Fizicheskiy institut AN SSSR (Physics Inst. AN SSSR) and a pair magnetic spectrometer as the γ detector. The cross section curve has five peaks at 16.5, 17.6, 19.1, 23, and 25.6 MeV. The measured C^{12} nuclear absorption cross section in the giant resonance region is compared with theoretical calculations and with experimental photonucleon spectra and cross sections for the $C^{12}(\gamma, n)$ and $C^{12}(\gamma, p)$ reactions in the same energy region. The integral cross section in this region is found to be 84 ± 10 MeV-mb and comprises about one-half the value calculated from the sum rule, indicating that in the case of carbon the giant resonance region below 30 MeV includes approximately half of the integral cross section for dipole transitions. "We wish to thank N. S. Kozhevnikov for much assistance with the measurement and data reduction, and B. A. Tulupov for numerous profitable discussions." Orig. art. has: 2 figures, 6 formulas, and 3 tables.

TITLE: The effect of nonmonochromaticity during measurements of the Gamma-quantum capture cross section on light nuclei

SOURCE: Yadernaya fizika, v. 1, no. 1, 1965, 46-47

TOPIC TAGS: giant resonance absorption, Gamma ray absorption, light nucleus, absorption cross section, nonmonochromatic radiation

ABSTRACT: This brief note explains that the integral γ-ray absorption cross sections for light nuclei in the giant resonance region obtained by measuring the total cross section utilizing the transmission method are lower than their true values in the case of relatively poor resolution and a thick sample. This is due to the fact that the calculations do not take into account the nonmonochromaticity of the radiation during resonant absorption, and the estimates made by the author (Preprint, ITEF, no. 254, 1964) show that data presented earlier by other authors (B. Ziegler, Nucl. Phys., 17, 238, 1960; M. A. Burgov, G. B. Danilyan, B. S. Dolbilkin, L. Ye. Lazareva, F. A. Nikolayev, ZhETF, 43, 70, 1962; 45, 1693, 1963)

TITLE: Investigations of the System SnTe-PbTe (Issledovaniye sistemy SnTe-PbTe)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1958, Vol 3, Nr 7, pp 1632-1636 (USSR)

ABSTRACT: The diagram of state and the thermoelectric properties of the system SnTe-PbTe, in which isomorphic compounds are formed, were investigated. In the ternary system Pb-Sn-Te continuous series of solid solutions form on the sector SnTe-PbTe. The electric conductivity and the thermoelectric conductivity of the alloys produced from SnTe and PbTe have the same type of conductivity. Modification of the properties of alloys produced from SnTe and PbTe is complicated. Alloys which are enriched with SnTe have a maximum of thermoelectric conductivity of positive value, but alloys enriched with PbTe have a thermoelectric conductivity of negative value. Electric conductivity passes through a minimum. There are 7 figures, 2 tables and 13 references.

TITLE: Thermal capacity of acid ammonium sulfate in the temperature interval from -70 to +14C

27 27

SOURCE: Fizika tverdogo tela, v. 5, no. 6, 1963, 1724-1727

TOPIC TAGS: thermal capacity, ammonium sulfate, Curie point, calorimeter

ABSTRACT: The authors measured the temperature dependence of thermal capacity in crystals of NH_4HSO_4 by using an adiabiatic vacuum calorimeter. Experimental data show a jump in the curve of temperature dependence on thermal capacity at a point near the Curie temperature (-2.55C). This jump does not appear on the theoretical curve relating the same two factors. This jump in the curve of observed values caused the authors to consider the effect of fluctuations in polarization and the irregularity of distribution of these fluctuations throughout the body of the crystal in the critical region. "In conclusion we express deep thanks to V. A. Koptsik, who suggested the idea of the present paper, A. A. Sklyankin and A. P. Levanyuk for useful discussions and valuable remarks,

TOPIC TAGS: indium 27 antimonide 27, semiconductor carrier, electrical conductivity, Hall constant, electron donor, microwave, electric field, magnetic field

21,44,55

ABSTRACT: 21,44,55 The effect of a microwave electric field at the 10-mm wavelength on the electrical conductivity (ρ) of n-type InSb was investigated in a magnetic field of 3 koe. The conductivity in the impurity band was distinguished from the free carrier conductivity by performing the experiments at 4.2 and at 1.1K. In high-purity samples with low ρ ($N_D - N_A = 1.1 \times 10^{13}$) the Hall constant ($R_H$) decreased sharply with an increase of the microwave power after the power reached a certain value. The decrease of R_H was greater at low temperatures, approaching a limit at 77K. As the microwave power was increased, an increase in ρ was observed simultaneously with the decrease of R_H (and long before R_H reached the critical value). It was established that the temperature of the samples did not increase during exposure to microwave

Card 1/2

2

L 9585-66

ACC NR: AP6001777

radiation. The increase in conductivity caused by microwave radiation was accompanied by an increase in the number of carriers in the impurity levels and in the conduction band due to a decrease in recombination of electrons with donors. The electric field corresponding to the sharp increase of ρ was 0.2—0.4 v/cm. Orig. art. has: 2 figures and 1 table. [CS]

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 13, 1965, 24

TOPIC TAGS: railroad, railway construction, railway engineering

ABSTRACT: This Author's Certificate introduces: 1. A device for mechanical installation of railroad track sections. The unit consists of a flatcar which can be moved along the track. The devices needed for mechanical installation of the track sections are located on the frame of the car. The device is designed for efficient mechanization of the process and for continuous and uninterrupted operation. The installation mechanisms are made in the form of synchronously moving conveyers mounted one above the other in pairs. A lower pair of conveyers carries clamps for the crossties. A middle pair carries a pulsating rack with catches for picking up the blocking, which is finished with spike tips upward. This middle pair of convey-

Card 1/2

3

ers feeds the blocking to a press with an electric drive mechanism for assembling all the elements of the track framework into a section which is ready for laying. An upper pair of conveyers is equipped with a pneumatic pushrod and rollers for feeding both rails to the press. The car also contains a mechanism for moving the assembled section along the installation unit. 2. A modification of this device with a centering unit for placing the crossties in the roadbed on a curve. The centering unit is made in the form of a horizontal bar which is an extension of the pneumatic cylinder rod with a spring-return clamp hinged to its end. 3. A modification of this device with provision for simultaneously pressing both ends of the crosstie onto all vertically standing spikes at once. The press is made in the form of a crankshaft and connecting rod mechanism interlinked with a press table which is located symmetrically with respect to the longitudinal axis of the press. The press is equipped with electromagnetic punches.

SUBJECT	USSR/MATHEMATICS/Theory of functions	CARD 1/1	PG - 670
AUTHOR	DANILJUK I.I.		
TITLE	Quasiharmonic and quasianalytic functions on surfaces.		
PERIODICAL	Uspechi mat.Nauk 11, 5, 95-101 (1956) reviewed 5/1957		

As is well-known, complex-valued functions the real and imaginary parts of which yield solutions of elliptic systems with two independent variables, possess certain properties which are similar to those ones of analytic functions. The author studies how far this local analogue remains in the large and he investigates in this connection the solutions of the mentioned elliptic systems on certain surfaces which are defined as two-dimensional orientable topological manifolds with restricting properties. The author obtains a maximum principle and a Harnack principle. Some theorems concern Hilbert spaces of quasi-analytic functions and the quasiconformal mappings of surfaces. A great part of the present results has already been announced (Doklady Akad.Nauk 105, No.1 (1955)).

[illegible] On quasianalytic functions of many variables or manifolds of an even number of dimensions. Dokl. Akad. Nauk SSSR (N.S.) 109 (1956), 434–437. (Russian)

A complex function [illegible] of many complex variables is called quasianalytic if it satisfies an elliptic system [illegible] ($\nu=1, 2$) for each complex variable [illegible] and is continuous, except at some isolated points, in all the variables. The author constructs a Hilbert space of quasianalytic functions, exhibits formulas and draws some conclusions based on the theory of continuous groups. No proofs are given.

TITLE On automorphic quasianalytic functions on surfaces.
PERIODICAL Mat.Sbornik,n.Ser. 41, 97-104 (1957)
reviewed 7/1957

A representation of the contents of this paper was already published in Doklady Akad.Nauk 109, 253-255 (1956).

AUTHOR: Danilyuk, I.I. SOV/20-120-1-3/63

TITLE: On the Mappings Which Correspond to the Solutions of Equations of Elliptic Type (Ob otobrazheniyakh, sootvetstvuyushchikh resheniyam uravneniy ellipticheskogo tipa)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 120, Nr 1, pp 17-20 (USSR)

ABSTRACT: Let the elliptic system

(1) $u_x - v_y = a(x,y)u + b(x,y)v \; ; \; u_y + v_x = c(x,y)u + d(x,y)v$

be given of the elliptic equation

(2) $$A_1(x,y)\frac{\partial^2 U}{\partial x^2} + 2B_1(x,y)\frac{\partial^2 U}{\partial x \partial y} + C_1(x,y)\frac{\partial^2 U}{\partial y^2} + D_1(x,y)\frac{\partial U}{\partial x} + E_1(x,y)\frac{\partial U}{\partial y} + F_1(x,y)U = 0$$

The author uses the solution methods for elliptic systems elaborated by Vekua [Ref 2,3], in order to show that under certain suppositions on the coefficients $a(x,y),\ldots, A_1(x,y),\ldots$ the system (1) and the equation (2) possess solutions in every finite simply connected domain G which realize an internal

Card 1/2

On the Mappings Which Correspond to the Solutions of Equations of Elliptic Type SOV/20-120-1-3/63

mapping of the domain G on a certain Riemannian surface according to Stoylov. In the case (2) the following suppositions must be satisfied : The coefficients $A_1(x,y),\dots$ must be analytic in x and y and must be continuable as analytic functions of $z = x+iy$ and $\zeta = x-iy$ into a bicylinder $G_z \times G_\zeta$. TITLE: On the Problem With a Skew Derivative for First Order Elliptic Systems (O zadache s kosoy proizvodnoy dlya ellipticheskikh sistem pervogo poryadka)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 1, pp 9-12 (USSR)

ABSTRACT: Let the domain G of the z-plane have the boundary $\Gamma = \sum_{j=0}^{m} \Gamma_j$; let Γ_j be simple closed, non-intersecting, H-continuous curves, where Γ_o includes all other ones. In G the equation

$$(1) \quad \frac{\partial f(z)}{\partial \bar{z}} = B(z)\overline{f(z)} \quad , \quad f=u+iv, \quad \frac{\partial}{\partial \bar{z}} = \frac{1}{2}\left(\frac{\partial}{\partial x} + i\frac{\partial}{\partial y}\right)$$

is considered. Problem B: Find a complex-valued function f continuous in $G + \Gamma$, which in G is the generalized solution of (1), on Γ has a continuously continuable derivative $\frac{\partial f}{\partial z}$ and on Γ satisfies the boundary condition

$$(2) \quad \mathrm{Re}\left[a\frac{\partial f}{\partial z} + bf\right] = \gamma, \quad \frac{\partial}{\partial z} = \frac{1}{2}\left(\frac{\partial}{\partial x} - i\frac{\partial}{\partial y}\right)$$

(a, b, γ are functions defined on Γ).

Theorem: In G let B(z) have a generalized derivative $B_z \in L_p(G)$,

Card 1/3

On the Problem With a Skew Derivative for First Order Elliptic Systems SOV/20-122-1-1/44

$p>2$. If $f(z)$ is the solution of the problem B, then the three functions

(3) $F_1(z) = f(z)$, $F_2(z) = \frac{\partial f(z)}{\partial z}$, $F_3(z) = \overline{f(z)}$

in G satisfy the system

(4) $\frac{\partial F_1}{\partial \bar{z}} = B\overline{F_1}$, $\frac{\partial F_2}{\partial \bar{z}} = B_z\overline{F_1} + |B|^2 F_1$, $\frac{\partial F_3}{\partial \bar{z}} = \overline{F_2}$

and on Γ they satisfy the conditions

(5) $\mathrm{Re}\left[aF_2 + bF_1\right] = \gamma$, $\mathrm{Re}\left[F_1 - F_3\right] = 0$, $\mathrm{Re}\left[iF_1 + iF_3\right] = 0$.

Conversely: If a system of functions continuous on $G+\Gamma$ solves the problem (4),(5), then F_1 is the solution of the problem B.

Theorem: The homogeneous problem (4)-(5) (i.e. $\gamma = 0$) and therewith the homogeneous problem B have only finitely many solutions linearly independent over the field of real numbers. For the solvability of the problem (4)-(5) and consequently the problem B it is necessary and sufficient that $\int_\Gamma h(t)\,\chi_j(t)\,ds = 0$, $j=1,2,\ldots,q$

Card 2/3

On the Problem With a Skew Derivative for First Order Elliptic System SOV/20-122-1-1/44

Here $h(t)$ is defined by the matrix form of the condition (5):

$$(5^*) \qquad \mathrm{Re}\left[g(t)F(t)\right] = h(t), \quad g = \begin{pmatrix} b & a & 0 \\ 1 & 0 & -1 \\ i & 0 & i \end{pmatrix}, \quad h = \begin{pmatrix} \gamma \\ 0 \\ 0 \end{pmatrix},$$

while χ_j are the solutions of the conjugate system $A^*(\chi) = 0$ if by $A\mu = h_1$ (μ - unknown vector function) the system of singular integral equations is denoted to which (4)-(5) can be reduced with the aid of a certain integral representation. Two further theorems reduce the solvability of the problem B and (4)-(5) to certain conditions for the solutions of the homogeneous problem conjugate to (4)-(5).
There are 5 Soviet references.

TITLE: Investigation of a Problem With Skew Derivative With the Aid of a System of Fredholm Equations (Issledovaniye odnoy zadachi s kosoy proizvodnoy pri pomoshchi sistemy uravneniy Fredgol'ma)

PERIODICAL: Doklady Akademii nauk SSSR 1958, Vol 122, Nr 2, pp 175-178 (USSR)

ABSTRACT: Let D be the unit circle, Γ its boundary, $z = x + iy$,

$$f = u + iv \ , \quad \frac{\partial}{\partial z} = \frac{1}{2}\left(\frac{\partial}{\partial x} - i\frac{\partial}{\partial y}\right) , \quad \frac{\partial}{\partial \bar{z}} = \frac{1}{2}\left(\frac{\partial}{\partial x} + i\frac{\partial}{\partial y}\right) .$$

Problem B_λ : A function f continuous in $D + \Gamma$ which is generalized solution of $\frac{\partial f}{\partial \bar{z}} = \lambda B(z)\overline{f(z)}$ and possesses a derivative which is continuously extendable on Γ is to be found, whereby it holds on Γ : $\mathrm{Re}\left[a\frac{\partial f}{\partial z} + \lambda bf\right] = \mu$. Here B(z) is

Card 1/4

a function given in D ; $B_z \in L_p(D)$, $p > 2$; a,b are continuously differentiable functions defined on Γ ; γ is H-continuous; λ a real parameter, $a(t) \neq 0$ for $t \in \Gamma$.
Problem C_λ : The generalized solution continuously extendable on Γ of the system $\frac{\partial F_1}{\partial \bar{z}} = \lambda B \bar{F}_1$, $\frac{\partial F_2}{\partial \bar{z}} = \lambda B_z \bar{F}_1 + \lambda^2 |B|^2 \bar{F}_1$, $\frac{\partial F_3}{\partial \bar{z}} = \bar{F}_2$, is to be found which satisfies on Γ the condition $\mathrm{Re}\left[g_1(t)F(t)\right] = h_1(t)$, where

$$g_1 = \begin{pmatrix} \lambda b & a & 0 \\ 1 & 0 & -1 \\ i & 0 & i \end{pmatrix}, \quad F = \begin{pmatrix} F_1 \\ F_2 \\ F_3 \end{pmatrix}, \quad h_1 = \begin{pmatrix} \gamma \\ 0 \\ 0 \end{pmatrix}$$

The problems B_λ and C_λ are equivalent (see [Ref 1]). By relatively simple transformations the system of the problem C_λ is brought into a special form. It is shown, that the solution of this special problem satisfies the system of in-

Card 2/4

Investigation of a Problem With Skew Derivative With the Aid of a System of Fredholm Equations

SOV/20-122-2-3/42

tegral equations $\varphi(z) = T_\lambda \varphi(z) + \phi(z)$, and conversely. The spectrum S^+ of the integral operator T_λ is denoted as the spectrum of the problems B_λ and C_λ (for a nonnegative index $\varkappa$). Here it is $\varkappa$ = increase of $\frac{1}{2\pi}\left[\arg \overline{a(t)}\right]$ for a single circulation on Γ in positive direction.

Theorem: S^+ is always discreet. If λ is no eigen value, then the homogeneous problems B_λ^o, C_λ^o possess exactly $2\varkappa + 3$ solutions linearly independent over the real number field; the inhomogeneous problems B_λ, C_λ are then solvable for an arbitrary right side. If $\lambda \in S^+$, then the number l of linearly independent solutions of B_λ^o, C_λ^o is equal to $l_* + 2\varkappa + 3$. Here l_* is the number of linearly independent solutions of the homogeneous conjugate problem and satisfies the inequalities $l_* \leqslant k$ and $l \geqslant k - 3$, where $k > 3$ is the multiplicity of λ.

Card 3/4

Investigation of a Problem With Skew Derivative With the Aid of a System of Fredholm Equations SOV/20-122-2-3/42

Similar results for $\varkappa < 0$ are given (if λ is an eigen value, then $l = 1$ or $l = 2$).

AUTHOR: Danilyuk, I.I. SOV/20-127-5-4/58

TITLE: On the Oblique Derivative Problem for the General Quasilinear Elliptic System of First Order

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 5, pp 953-956 (USSR)

ABSTRACT: Let the quasilinear elliptic system of first order with the unknowns u, v be given in complex form ($w = u + iv$):

$$\frac{\partial w}{\partial \bar{z}} + \mu_1(z,w)\frac{\partial w}{\partial z} + \mu_2(z,w)\frac{\partial \bar{w}}{\partial \bar{z}} + \nu(z,w) = 0$$

(1)

$$\frac{\partial}{\partial \bar{z}} = \frac{1}{2}\left(\frac{\partial}{\partial x} + i\frac{\partial}{\partial y}\right) ; \quad \frac{\partial}{\partial z} = \frac{1}{2}\left(\frac{\partial}{\partial x} - i\frac{\partial}{\partial y}\right).$$

Let $z \in D$, $w \in R$. Let on the boundary Γ of D a differential operator of first order be given

(2) $\tilde{\omega}(z,u,v,u_x,u_y,v_x,v_y) \equiv \mathrm{Re}\,\omega(z,w,w_{\bar{z}},w_z)$.

Card 1/3

On the Oblique Derivative Problem for the General Quasilinear Elliptic System of First Order SOV/20-127-5-4/58

Problem F : In the class $W_p^{(1)}(D)$, $p > 2$ there is to be determined a function w satisfying in D the equation (1) and on Γ the boundary condition (2) . As in [Ref 1,2] the author formulates a Riemann-Hilbert problem E for certain new unknown functions F_1, F_2, F_3, whereby now the boundary condition contains no derivatives. In theorem 1 the author proves : If $w = w(z)$ is solution of F , then $F_1 = w$, $F_2 = \frac{\partial w}{\partial z}$, $F_3 = \overline{w}$ are solutions of E ; conversely : If F_1, F_2, F_3 are solutions of E, then F_1 is solution of F. Then the author restricts himself to the case $\omega \equiv a(z) \frac{\partial w}{\partial z} + b(z)w$, where a and b are continuously differentiable on Γ , $a \neq 0$ on Γ . Under certain further assumptions (among others the coefficients of (1) have to satisfy the Lipschitz conditions) it is shown (theorem 2 and 3) that the problem F possesses a unique solution. The author distinguishes two cases

Card 2/3

On the Oblique Derivative Problem for the General Quasilinear Elliptic System of First Order SOV/20-127-5-4/58

(in dependence of the sign of $\varkappa = \frac{1}{2\pi}\left[\arg \bar{a}(z)\right]_{\Gamma}$) .

TITLE: General Representation of Solutions to Axially Symmetrical Stationary Problem

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 4, pp. 743-746

TEXT: Theorem 1: Under the assumption

$$(3)\quad \begin{aligned} \frac{\partial A(z,\zeta)}{\partial z} - B(z,\zeta)B^*(\zeta,z) &= -C_1(z,\zeta)A(z,\zeta) \\ \frac{\partial B(z,\zeta)}{\partial z} - B(z,\zeta)A^*(\zeta,z) &= -C_1(z,\zeta)B(z,\zeta), \end{aligned}$$

where $C_1(z,\zeta)$ is a function analytic and regular in $(D_z \times D_\zeta)$, every solution of the equation

$$(2')\quad \frac{\partial F(z,\zeta)}{\partial \zeta} + A(z,\zeta)F(z,\zeta) + B(z,\zeta)F^*(\zeta,z) = 0$$

the coefficients of which are analytic and regular in the bicylindric domain $(D_z \times D_\zeta)$, $D_\zeta = D_{\bar{z}}$, can be represented in the form:

Card 1/4

General Representation of Solutions to Axially Symmetrical Stationary Problem S/020/60/132/04/03/064

(5) $$F(z,\zeta) = \alpha G(z_0,\zeta_0,z,\zeta) + \int_{z_0}^{z} \varphi(t) G(t,\zeta_0,z,\zeta)\,dt + \int_{\zeta_0}^{\zeta} \varphi_1(\tau) G(z_0,\tau,z,\zeta)\,d\tau,$$

where G is the Riemannian function of the equation

(4) $$\frac{\partial^2 F(z,\zeta)}{\partial z\,\partial\zeta} + A(z,\zeta)\frac{\partial F(z,\zeta)}{\partial z} + C_1(z,\zeta)\frac{\partial F(z,\zeta)}{\partial \zeta} = 0,$$

z_0 - fixed point of the D_z, $\zeta_0 = \bar{z}_0$, α = const. and $\varphi(t)$, $\varphi_1(\tau)$ are combined by the differential equation

(6) $$\varphi(z) = -\frac{1}{B^*(\zeta_0,z)}\frac{d\varphi_1^*(z)}{dz} + \frac{1}{B^{*2}(\zeta_0,z)}\left[\frac{\partial B^*(\zeta_0,z)}{\partial z} - C_1(z,\zeta_0)B^*(\zeta_0,z)\right]\varphi_1^*(z),$$

where $\varphi_1(\zeta_0) = -\alpha B(z_0,\zeta_0)$ and $B^*(\zeta_0,z) \neq 0$.

Reversely: If $\varphi(t)$, $\varphi_1(t)$ satisfy the equation (6), if they are regular in D_z and D_ζ, respectively, and if $\varphi_1(\zeta_0) = -\alpha B(z_0,\zeta_0)$ then (5) is the

Card 2/4

solution of (2') for arbitrary values of the constant α. [Abstractor's note: The star is defined by $F^*(\zeta,z) = \overline{F(\bar{\zeta},\bar{z})}$]. From this theorem there results in the special case the behavior of the solutions of the hydrodynamic equations (incompressibility, absence of sources and vortices for an axialsymmetric flow)

(1) $\frac{\partial}{\partial x}(rV_x) + \frac{\partial}{\partial r}(rV_r) = 0, \quad \frac{\partial}{\partial x}V_r - \frac{\partial}{\partial r}V_x = 0.$

Putting $z = x-ir$, $f = V_r + iV_x$, $\frac{\partial}{\partial \bar{z}} = \frac{1}{2}\left(\frac{\partial}{\partial x} + i\frac{\partial}{\partial r}\right)$, then (1) can be replaced by

(1') $\frac{\partial f}{\partial \bar{z}} - \frac{1}{4ir} f - \frac{1}{4ir}\bar{f} = 0.$

The solution of (1') can be represented by $f(x,r) = F(z,\bar{z})$, where $F(z,\bar{z})$ satisfies the equation

(2) $\frac{\partial F(z,\zeta)}{\partial \zeta} \frac{1}{2}\frac{1}{z-\zeta}F(z,\zeta) - \frac{1}{2}\frac{1}{z-\zeta}F^*(\zeta,z) = 0,$

General Representation of Solutions to Axially Symmetrical Stationary Problem S/020/60/132/04/03/064

which is a specail case of (2'). Theorem 2 describes the relations in this case. The author mentions I.N.Vekua. There are 4 references: 3 Soviet and 1 Italian.

A problem with a directional ...

$$v(z, F_1, F_2) =$$
$$= \left[1 - \left|\frac{\partial g}{\partial \bar{F}_2}\right|^2\right]^{-1} \left[\frac{\partial g}{\partial z} + \frac{\partial g}{\partial F_1} F_2 + \frac{\partial g}{\partial \bar{F}_1} \bar{g} + \frac{\partial g}{\partial \bar{F}_2} \left(\frac{\partial \bar{g}}{\partial \bar{z}} + \frac{\partial \bar{g}}{\partial \bar{F}_1} \bar{F}_2 + \frac{\partial \bar{g}}{\partial F_1} g\right)\right].$$

The boundary conditions of the second form contain no derivatives of the sought functions. This fact is of great importance. For the solution of such problems, a number of theorems of existence are derived. Vekua N. P. (Obobshchennyye analiticheskiye funktsii - Generalized analytic functions, Fizmatgiz, M., 1959) is referred to. There are 20 references: 17 Soviet and 3 non-Soviet. The reference to the English-language publication reads as follows: Tamarkin J. D. On Fredholm's integral equations, whose kernels are analytic in a parameter, Ann. of Math., 2, Ser. 28 (1947), 127 - 152.

TITLE: Study of spatial boundary value problems with axial symmetry

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 146, no. 3, 1962, 523-526

TEXT: The elliptic system

$$\frac{\partial}{\partial x}(rV_x) + \frac{\partial}{\partial r}(rV_r) = rG_1(x,r)$$

$$\frac{\partial}{\partial x}V_r - \frac{\partial}{\partial r}V_x = G_2(x,r)$$

in a multiply connected unbounded region G of the upper semi-plane $r \geq 0$ is considered. The boundary condition

$$\alpha V_x + \beta V_r = \gamma$$

is set up for that part of the margin which does not lie on $r=0$; where α, β, γ are given functions. The system is considered in the complex plane

Card 1/2

by introducing the field

$$f = V_r + iV_x,$$

For the zeros of f a general theorem is proved from which a number of conclusions are derived as to the uniqueness, existence, and properties of the solutions of the homogeneous ($\gamma \equiv 0$) and inhomogeneous problems. Among other applications, these can be used in solving the external Neumann problem in the case of axial symmetry.

TITLE: On the theory of one-dimensional singular equations

PERIODICAL: Referativnyy zhurnal, Matematika, no. 7, 1962, 60, abstract 7B287. ("Probl. mekhaniki sploshn. sredy". M., AN SSSR, 1961, 135-144)

TEXT: The operator

$$K^{o}\varphi = a(s)\varphi(s) + \pi^{-1}b(s)\int_{0}^{2\pi}\left[1 - \exp i(s - \sigma)\right]\varphi(\sigma)d\sigma$$

is considered, where the integral is understood in the sense of the Cauchy principal value, while a(s) and b(s) satisfy the conditions: 1.) There exist positive numbers m,M such that the inequalities

$$|a(s)| \leqslant M,\ |b(s)| \leq M,$$

$$|a(s) + b(s)| \geqslant m,\ |a(s) - b(s)| \geqslant m$$

hold almost everywhere on $[0,2\pi]$; 2.) there exists a unique branch $\theta(s)$

Card 1/3

of the function arg $[(a-b)(a+b)^{-1}]$ such that the boundary values $\theta(\sigma - 0)$, $\theta(\sigma + 0)$ exist in every point $\sigma \in [0,2\pi]$, where the difference $h(\sigma) = \theta(\sigma + 0) - \theta(\sigma - 0)$ vanishes for all $\sigma \in [0,2\pi]$ except on a closed at most denumerable point set $\{s_k\}$ and the series

$$\sum |h(s_k)|$$

converges ; 3.) $\theta(s) = \theta_0(s) + \theta_1(s)$, where $\theta_0(s)$ is a continuous 2π - periodic function and $\theta_1(s)$ is the function of the jumps of $\theta(s)$. In the paper results are given on the homogeneous equation $K^0\varphi = 0$, $\varphi \in L_p, p > 1$, and on its adjoint equation which have been known up to now only for the case, where $a(t)$, $b(t)$ are continuous and $a^2 - b^2 \neq 0$ everywhere on $[0,2\pi]$. If $f \in L_p$ and if moreover a certain additional condition is

JB

satisfied, then corresponding results are given also for the inhomogeneous equation $K^0 \varphi = f$ as well as for $K^0 \varphi + L \varphi = f$, where L is a completely continuous operator in L_p.

TEXT: The stability of the phase detector is obtained by using the transistors in inverted connection (collector-emitter interchanged). Four detectors were tested using alloy-junction transistors, under varying conditions of temperature, carrier frequency, etc. Suppression of residual signals improved with increase of frequency, and deteriorated with increase of temperature.
There are 2 figures and 4 tables.
